

## Customization Manager

Customization Manager is a tool that makes it possible to customize your SBT screens. And when it's time to install future builds, you can preserve your changes. This will save you from having to redo modifications every time you update to a new build.

Customization Manager is purchased as a separate module and includes the following features:

- It gives you the ability to create custom screen forms as subclasses of existing forms and make custom screens available to specific users/companies
- It allows you to create Visual FoxPro expressions that define the conditions in which a particular custom form is to be launched
- It allows our Integration Partners to deploy custom screen forms with out changing the existing SBT form
- It provides the ultimate flexibility to change screen object properties like field name labels, fonts, colors, field sizes, etc. on SBT screen forms
