

System Manager

System Manager is the control center for your SBT® system. With System Manager, you can configure hardware and workstation settings, user security, and more. Its data dictionary provides utilities for viewing and maintaining database files, and lets you modify and create your own custom databases and indices. Pro Series System Manager now includes ProAlert™ and Message Master™.

Features of System Manager

- Data dictionary stores information about your applications and custom database files, their fields and indices, data types, and program processes
- Hot-key file browsers let you create user-defined, pop-up windows that list up-to-the-minute data from any file in the data dictionary using PowerDrill browser technology
- Reports user audit trails, including a historical record of each function performed by users
- Enables you to change key values, such as customer, inventory item, or vendor numbers throughout the system
- Includes laser printing technology to produce high-quality, low-cost business forms on plain paper
- Password maintenance lets you control user access by function, time of day, and date range
- Option to encrypt user ID, passwords, and name for added security
- Users can view various records (inventory items, customers, vendors, and GL accounts) without being able to edit them
- Rule tables provide data entry lookup tables for installed SBT applications
- Handles all application period closes and allows simultaneous closing of multiple applications
- Custom menus allow you to access up to 10 different custom options
- Multiple workstations allow you to enter information about each workstation on your system, including the monitor and modem
- Displays reports in scrollable windows
- Fiscal calendars let you define up to 13 periods and control postings from all applications
- Network messaging allows you to receive and file phone messages from vendors or customers, and send or receive messages to communicate with other users
- System Recovery utilities can up-date and verify database file structures and indices, clear user flags and file locks, delete unused temporary files, and clear the error log
- Error log tracks error code, type, and the workstation that generated any system warning or error message
- With ProAlert you can automate process flows by using clearly specified events that trigger specified actions. ProAlert acts as a "business robot," automatically searching for business events described by you, and then taking appropriate action in response
- SBT Message Master enables you to send any report via email, fax or as a file/attachment. You can also: simultaneously fax, email and print the same report; send reports to unlimited recipients simultaneously; schedule faxes to be sent at any time of day; customize email/fax settings by user; attach binary files, and review a log of all documents transmitted
- Soundex can be turned on or off without source code

Standard Reports

Each report may be customized from a matrix of user-selected options, displayed, printed, exported to a spreadsheet, faxed, emailed or saved on disk. Some of the reports included are:

- Disk Usage Report
- Key Change Audit Log
- Key Change List
- Setup Information Report
- System Confirmation
- User Activity Report
