Product Brief

Citrix® NFuse™

Citrix® NFuse™ 1.6

*Securely **integrate** and **publish applications** into corporate portals—for **access** via any standard **Web** browser. **Today.***

About Citrix

- Founded in 1989, Citrix Systems, Inc. (Nasdaq: CTXS) is a global leader in application serving software and services that offer the ability to deliver any application to any device over any connection—wired, wireless or Web.

- Citrix solutions enable organizations of all types and sizes to reach more users, with more applications, in more locations—and achieve this with greater speed, improved predictability and lower costs.

- With over 24 million users worldwide, Citrix solutions have been adopted by over 90 percent of Fortune 500® firms and more than 50 percent of the Financial Times 500.

CITRIX®

Now everything computes.™

Today's highly competitive, global business environment demands fast, easy access to business-critical applications and information—any time, in any location, using any device. Citrix® NFuse™ 1.6 extends the virtual workplace—the seamless integration of LANs, WANs, the Internet, Intranets and Extranets—via a corporate portal by providing employees, suppliers and customers with the business-critical information and applications they need to succeed. With Citrix NFuse 1.6, companies can deliver applications over any kind of Internet connection—wired or wireless—without the expensive, time-consuming and arduous task of rewriting application code. Citrix NFuse 1.6 enables users to connect to applications in their native forms, for true mobility at customer sites, airports, hotels, home—anywhere business requires.

Citrix NFuse 1.6 is a cornerstone technology for the future when all information and application delivery will be extremely personalized. As Web-based access becomes an integral part of doing business, Citrix customers will be well-positioned for success. Since Citrix NFuse is built into Citrix MetaFrame XP™ and is compatible with earlier versions of Citrix MetaFrame®, customers are also able to leverage the benefits of a cost-effective application serving solution, including the ability to centrally manage and scale implementations. And because Citrix NFuse provides the tools needed to take full advantage of the Internet as a delivery channel for applications and content, customers can meet current and future computing needs and leverage their existing applications over the Net.

Quick, easy access to existing and new applications.

Citrix NFuse 1.6 application portal software gives IT departments the power to provide users with universal access to the broadest range of applications—including Windows®, UNIX®, Java™ and Web-based applications via a standard Web browser. Now companies can enhance corporate portals by providing access to published interactive applications. Using Citrix NFuse 1.6, IT administrators can:

- Publish applications and content from a single point.

- Publish applications to Microsoft® Active Directory™ and Novell® NDS® users and groups.

- Allow users to download Citrix Independent Computing Architecture (ICA®) client software from a Web page.

Personalize applications and content for each user.

Citrix NFuse 1.6 makes it easy to personalize the selection of applications that a user can access — or even to personalize the browser itself and the content associated with it. This level of personalization can further enhance the user's computing experience by providing links to company information and news, as well as other content. Customization features in Citrix NFuse 1.6 allow administrators to:

- Personalize the applications and data a user receives to create completely customized, Citrix NFuse-enabled websites.

- Give both explicit and anonymous users the ability to connect to applications and content via the same Citrix NFuse Web page.

- Simplify client configuration and enhance usability by pre-determining a default folder.

- Use custom Web pages or templates provided to develop a unique look and feel.

- Allow users to quickly and easily renew expiring passwords via the Citrix NFuse Web interface.

Citrix NFuse 1.6 delivers robust application management.

Citrix NFuse 1.6 gives administrators enterprise-class command and control to streamline IT operations. Centralized management makes it easy to display published applications to users from multiple server farms. With Citrix NFuse 1.6, users get the applications that best meet their needs, and administrators deliver and manage them without leaving the command center. Citrix NFuse 1.6 helps IT staffs:

- Maintain the enterprise-class command and control services of Citrix MetaFrame.

- Gain a high level of fault tolerance. Administrators can designate multiple back-up Citrix MetaFrame servers to authenticate users. Citrix NFuse contacts back-up servers automatically if the system registers a failed request.

- Provide added security and peace of mind with SSL encryption which allows Citrix ICA and XML content to pass through the firewall via the HTTPS port without additional firewall configuration work.

- Experience a faster authentication process by pre-programming the default domain required by Citrix NFuse users.

For more information.

For more information on Citrix NFuse 1.6 and how any organization can leverage the Web to provide applications and content to all its users, contact any authorized member of the Citrix Solutions Network™ worldwide, or visit **www.citrix.com**
